AB A transparent superhydrophobic TiO₂ film, prepared by spin-coating a TiO₂ slurry on a glass substrate and modifying the resultant TiO₂ film with fluoroalkylsilane mols., was patterned by illumination with UV light through a photomask, producing a superhydrophobic/superhydrophilic surface micropattern with very small superhydrophilic areas, which we were able to selectively fill with alginate hydrogel.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB The invention relates to a production process of an electroluminescent element, which, even when a buffer layer patterned by a photolithog. process is formed, luminescence failure derived from cross contamination or a variation in film thickness does not take place and can realize high production efficiency. The production process entails repeating at least twice the step of forming an electroluminescent layer comprising a buffer layer and a luminescent layer by patterning using a photolithog. process, thereby producing an electroluminescent element comprising a patterned electroluminescent layer, and comprises the steps of forming a first pattern part comprising a first buffer layer as the lowermost layer; and coating a solution for second buffer layer formation in a region including said first pattern part, the first buffer layer being immiscible with said solution for second buffer layer formation.

 DOCUMENT TYPE: Journal
 LANGUAGE: English
 AB Using Et acetoacetate (EAcAc) as a chelating agent, titanium dioxide (TiO₂) sol with ultra-fine particles has been prepared and deposited on Type 316L (UNS S31603) stainless steel to form a nano-TiO₂ coating by the dip-coating. A hydrothermal post treatment method has been applied to obtain crack-free coatings and to optimize the surface structure and properties. A self-assembly of fluoroalkylsilane (denoted as FAS-13) has been conducted to enhance the hydrophobic property for the surface of the nano-TiO₂ coatings. The particle sizes of TiO₂ sol have been analyzed by ζ potential anal., and the surface morphol., structure, and properties have been characterized by contract angle, x-ray diffraction, and SEM measurements. The surface of the coatings is porous, with approx. 375 nm thickness; the diameter of the particles of anatase TiO₂ is uniform, in the range from 15 nm to 18 nm. The electrochem. tests have indicated that the hydrophobic coatings of nano-TiO₂ exhibit an excellent corrosion resistance.

AB A composite decorative panel is provided to increase pollution resistance and self-cleaning capacity by coating the surface with pollution resistant coating materials composed of titanium dioxide and hydrolyzates of alkyl silicate. The composite decorative panel having excellent pollution resistance and self-cleaning capacity is formed by forming a pattern layer on one or two sides of a noncombustible core layer and forming a pollution resistant coat layer on the outside surface of the pattern layer. The pollution resistant coat layer is made with pollution resistant coating materials composed of titanium dioxide as a photo catalyzer and hydrolyzates of alkyl silicate as a binder.

AB Antimicrobial comps. with superior efficiency, especially against fungi, contain an inorg. antimicrobial compound and organic compound (I, where R1, R4

= same or different C1-4 (un)branched alkylene; R2, R5 = H, same or different halo, lower alkyl, lower alkoxy; R3 = C2-12 (un)branched alkylene; R6 = C1-18 (un)branched alkyl; Z = Cl, Br, I, or OSO2R7, R7 = lower alkyl, (un)substituted Ph) that is supported on a layered silicate. Thus, a composition containing I (R1, R4 = CH2; R3 = (CH2)4; R2, R5 = H; R6 = (CH2)7Me; Z = Br) supported on a Ca-type layered silicate and Ag0.53Na017H0.30Zr2(PO4)3 at 67.5 ppm inhibited growth of Aspergillus niger.

AB The laminated material is composed of inorg. layer and crystal linear chain organic layer alternatively, where the inorg. layer is composed of SiO₂ or/and TiO₂, the organic layer is composed of C10-18 linear chain acyloxy groups. The depth of inorg. layer is adjusted by using amount of n-silicate or titanate. The molar ratio of C10-18 linear chain alkyl acyloxysilicate or C10-18 linear chain alkyl acyloxytitanate to tetraalkyl n-silicate or tetraalkyl titanate is varied during 1: 0-1: 20. The preparation comprises the following steps: (1) selecting tetraalkyl silicate and tetraalkyl titanate; (2) selecting n-decanoic acid or stearic acid, reacting at 70-120° for 0.5-5h to obtain n-decanoic acid or stearic acid substituted linear chain alkyl acyloxysilicate or alkyl acyloxytitanate; (3) mixing with tetraalkyl silicate or tetraalkyl titanate at a molar ratio of 1: 0-1: 20, hydrolyzing at 20-70° under basic condition or/and polycondensating, separating, drying. The material has good application prospect in preparing composite material and adsorption separation

AB A planarization composition is set forth for chemical mech. planarization of dielec. layers for semiconductor device manufacture. The composition comprises spherical SiO₂ particles having an average diameter of 30-400 nm, and a narrow range of particle sizes, in which .apprx.90% of the particles are within 20% of the average particle diameter. The composition includes a liquid carrier comprising $\leq 9\%$ alc. and an amine hydroxide in the amount of .apprx.0.2-9% by weight. The pH of the composition is .apprx.9-11.5, and the remainder of the solution is H₂O. The composition has low amts. of metal ions, and the composition is used for thinning, polishing, and planarizing interlayer dielec. films, shallow trench isolation structures, and isolation of gate structures. The invention also comprises methods for using the planarization composition in the manufacture of semiconductor devices.

AB The glossy pigments are obtained by heating TiO₂-coated silicate platelets in a reducing atmospheric, followed by reaction with a silane

RaSi_x4-a

[each R = o-substituted C1-10 alkyl, where the substituent is glycidyl, NH₂, alkylamino, or C1-10 alkoxy, where the alkyl of the alkoxy group may be interrupted by 1-5 O or NH groups; X = C1-4 alkoxy; a = 1, 2]. Thus, 4 kg of a com. TiO₂-coated mica pigment which had been reduced in an NH₃ atmospheric at 800° was subjected to 120 g (3-aminopropyl)triethoxysilane vapors in an atmospheric of N and water vapor

for 10 min to give a pigment containing 0.5% C. A polyester coating containing 4% of this pigment applied to Al or steel panels, overcoated with an acrylate-melamine clear coat, and baked 30 min at 130° showed no apparent change in color or gloss after 24 h in an atmospheric of 100% humidity or after 24 h immersion in 80° water.

AB A precursor powder composition comprises a resin, of zinc dust, powder, and/or coated microspheres and graphite, said powder being soluble in a solvent blend at a facility remote from the powder manufacturing facility, thereby, decoupling the powder manufacturing process from the end use of the powder which

could be in a traditional solvent-based coating. The coating compns. for use in protecting metallic substrates from corrosion comprise necessary additives and film-forming substances including alkyl silicate, epoxy resins, powder and non-powder, and polyester resins, all the compns. being modified with .apprx.4-20% graphite powder based on total weight of the composition The graphite enhances the elec. conductivity and facilitates cathodic protection. A typical baking powder which may be post blended with a solvent mixture comprises Epon 2012 9.5, phenolic hardener DEH 84 3, phenolic hardener DEH 85 1.5, 20-60 μ m Zn powder 50, 8-12 μ m Zn powder 23, 2-5 μ m Zn dust 5, 5-10 μ m graphite 7.5, and silica 0.3 part.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB The title composition, having good resistance to phase separation during storage, contains alumina or TiO₂ as an antiliming agent and poly(acrylic acid) (or a salt) as an antispotting agent and is useful for machine washing of dishes without a rinse aid or hand drying. A composition containing H₂O 31.04, mono- and di-C16-18-alkyl phosphate 0.16, NaOH (50%) 2.34, Na₂CO₃ 4.88, Na₅P₃O₁₀ 11.70, Na₅P₃O₁₀.6H₂O 11.70, alumina (particle size 0.02 µm) 2.5, Alcosperse 149 8.00, Gel White H Clay 1.22, Al stearate 0.09, Dowfax 3B2 0.78, NaOC1 (11%) 8.78, and Na silicate 16.81% was used in hard water at 120°F for washing dishes, leaving no film or spots.

AB Heat- cold- water- and light-resistant title coatings for glass sheets contains 0.1-35% ≥1 of TiO₂, carbon black, and CaCO₃ as opacifiers

based on organopolysiloxane in the composition. Thus, a composition containing Me2SiOH-terminated polysiloxane 100, ground silica 137, hydrogenated castor oil 1.7, hydrocarbon solvent 65.4, and TiO2 22.6 parts was cured with a 1:10 catalyst-alkyl silicate mixture to give a product that resisted -50° and exhibited tensile strength 3.5-40 N/mm2, no change in tensile strength or elongation after 26 wk at 82°, no cracking or checking or pinholes at 5° under UV light (ASTM-526-70), and <0.5% water absorption after 7 days (ASTM D-570). The uncured composition was applied at 0.72 kg/mm2 to solar reflecting glass to give a coating that exhibited no peeling, fading, or degradation after 20 mo exposure of the uncoated side of the glass to daylight.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB A facial mask composition for controlling acne contains benzoyl peroxide 0.5-10, an inorg. thickening agent (Mg Al silicate or bentonite) 9-13, an absorbent powder (kaolin or bentonite) 20-25, a humectant (glycerol, sorbitol or propylene glycerol) 2.5-15%, and q.s. solvent (H₂O, lower alkyl alc., or mixts. thereof). This composition can effectively penetrate comedones without keratolytic or desquamating effects. Thus, a formed day mask lined with a composition containing benzoyl peroxide 2.0-10.0, TiO₂ 1.3-50, kaolin 20-25, glycerol 2.5-15.0, SDP-40 alc. 0.0-10.0, bentonite 9.0-13.0, and H₂O 35-45% by weight inhibited facial acne in humans after 1 wk of 20 min/day applications.

AB Ultrafine spherical TiO₂, SiO₂, and Al₂O₃ particles were prepared by the thermal decomposition of their alkoxide vapors, produced by evaporation and subsequent heating. High-concentration ultrafine particles having geometric mean diams. of 0.01-0.06 μ m and a geometric standard deviation of about 1.4 were obtained by varying the temps. of the evaporator containing the liquid alkoxides and the reactor furnace, and the flow rate of carrier gas. For furnace temps. <400° for TiO₂ and 1000° for SiO₂ and Al₂O₃, the particles obtained were amorphous. The changes in the particle-size distributions due to changes in operating conditions were compared with those predicted theor. by solving the discrete-continuous aerosol general dynamic equation accounting for coagulation and generation of monomer by thermal decomposition. The effect of monomer number concentration on the size distribution of generated particles was qual. explained.

AB TiO₂ particles are dispersed in organic media by coating the particles with 1-2% (estimated as weight of SiO₂ on TiO₂) of a C1-10 alkyl silicate. Before treatment with the alkyl silicate, the particles are treated with 0.5-3% of a metal oxide by weight of TiO₂, or 0.1-3% of a metal phosphate (by weight as P₂O₅ on TiO₂). Thus, rutile TiO₂ particles were wet-coated with 2% alumina, mixed with iso-Pr silicate (containing 39% SiO₂) to give a 0.3% SiO₂ concentration and passed into a fluid energy mill at 275°F. and 90 psig. (steam-pigment ratio is 1.5:1), to prepare a coated TiO₂ pigment containing 1.2% SiO₂. The SiO₂-coated TiO₂ pigment showed much better brightness and opacity, had a superior contrast ratio of 98-5%, and a very good to excellent dispersion rating compared to ordinary TiO₂ pigments.
